

Progress report for week 12

Cleanup:

I commented and cleaned up my code.

Differential Evolution:

I wrote the script for differential evolution. The computation takes really long because I am currently simulating each individuum of a population one at a time. That is why I could not test if it works yet. I will implement a parallelized algorithm next week.

Pose Estimation:

The Iterative PNP method works much better than P3P as can be seen below.
